

Escrow Enterprise Server

11 May 2017

The archive contains all the code and utilities for Enterprise Server.

- Enterprise/Build
 - Scripts used by Jenkins projects to build and autotest the server.
- Enterprise/Enterprise
 - This is the most important folder; It contains the server as it is packaged to the customers. The package itself and the installation procedure of the server is described in the Admin guide. Note that some subfolders are excluded from the package, which are described below instead:
 - Enterprise/Enterprise/server/buildtools
 - This folder is not shipped with the server but is used build time only. It contains scripts that automatically upgrade PHP classes after making manual changes to the Enterprise/Enterprise/server/dbscripts/dbmodel.php and/or one of the WSDLs in the Enterprise/Enterprise/server/interfaces folder.
 - Enterprise/Enterprise/server/buildtools/composer
 - This folder contains scripts using PhpComposer to upgrade the 3rd party libraries under Enterprise/Enterprise/server/vendor.
 - Enterprise/Enterprise/server/useful
 - This folder is not shipped with the server. It contains scripts that may be useful for particular/rare cases. Scripts could be handed out by development on request.
- Enterprise/Integrations
 - This folder contains modules to be installed into 3rd party products. Having that in place, the server can integrate with those products.
- Enterprise/Libraries
 - This folder contains a clean downloaded copy of the original libraries needed by the server. Another copy is made into Enterprise/Enterprise/server/<library> which could be a subset or patched by WoodWing to suit the server. While upgrading libraries, it enables us to compare 'our' changes with 'their' changes. (Note that vendor libraries are not part of this.)
- Enterprise/plugins
 - This folder contains plugins that can be installed in the config/plugins folder of the server. It mostly contains sample plugins that can be used for demo, study or inspiration. The release subfolder contains plugins that integrate with 3rd party publish services which are officially supported.
- Enterprise/ProxyForSC
 - This folder contains a subproduct of the server named Proxy for Smart Connection. It can be installed at remote location to speedup the up/download of large InDesign files when Smart Connection is opening or saving layouts.

Every IDE suitable for PHP can be used to develop the server. As long as the Enterprise/Enterprise folder is accessible by a webserver supporting PHP.
